

# App store use case steps

## User login interface

1. The user starts the login process by entering their **username**.
2. The system verifies the username.
3. If the username is correct, the system prompts the user to enter the **password**.
4. The system verifies the password.
5. If the password is correct, the system generates a **random verification code** and displays it to the user.
6. The user is prompted to input the **verification code**.
7. The system checks if the verification code matches the generated code.
8. If the verification code is correct, the system grants the user access with a "**Welcome**" message.
9. The use case ends.

## Store interactive interface

1. **System displays the electronics product catalog:**
  - The system shows the available electronics products in a table format, displaying each product's name, price, and quantity in stock.
2. **Customer selects an electronic product:**
  - The customer inputs the name of the product they want to purchase.
  - The system checks if the product exists in the catalog.
  - If the product does not exist, the system asks the customer to re-enter a valid product name.
3. **Customer specifies the quantity:**
  - The customer enters the quantity they wish to purchase.
  - The system checks if the requested quantity is available in stock.
  - If the quantity is insufficient, the system prompts the customer to enter a different quantity.
4. **System calculates the discount:**
  - The system checks the quantity purchased and calculates a discount of 5% for every 5 units purchased (up to a maximum discount of 25%).
  - The system calculates the total price after applying the discount.
5. **Customer reviews the discounted price:**
  - The system displays the discounted price for the selected product.
6. **Customer decides whether to purchase additional products:**
  - The system asks the customer if they want to add more products to their order.
  - If the customer selects another product, the steps from 2 to 5 are repeated.
  - If no more products are selected, the customer proceeds to checkout.
7. **System adds delivery or pick-up charge:**
  - The customer chooses between delivery and pick-up.
  - The system applies the corresponding charge (delivery = \$200, pick-up = \$50) to the total order price.

8. **Customer selects the payment currency:**
  - The system asks the customer to select a currency (USD, EUR, or EGP).
  - The system calculates the total price based on the chosen currency's exchange rate.
9. **System displays the final total price:**
  - The system displays the total price after applying any discounts, additional charges, and currency conversions.
10. **System confirms the order:**
  - The system informs the customer that the order is on its way after the payment has been processed.

**. Extensions (Alternate Scenarios):**

- **Product not found:**
  - If the product name entered by the customer is not found, the system informs the customer and asks for a valid product.
- **Quantity exceeds available stock:**
  - If the requested quantity exceeds the available stock, the system prompts the customer to re-enter the quantity.
- **Invalid currency input:**
  - If the customer enters an invalid currency, the system defaults to USD.

**. Post conditions:**

- The system has reduced the stock of the selected products based on the quantity purchased.
- The final discounted price, including any delivery or pick-up charges, is displayed and processed for payment.
